

Exactly.

This is actually the biggest missing piece in the entire system.

Right now you've designed **the presentation layer** (what the user sees).

Now we need to design **the intelligence layer** (where AGNUS gets its knowledge).

This is where AGNUS becomes a real product.

I think we're missing one major concept

I would create something called:

Intelligence Sources

or

Data Sources

or

Knowledge Sources

Personally I like:

Knowledge Sources

because AGNUS is a knowledge company.

The architecture

Imagine this:

External World

↓

Knowledge Sources

Knowledge Engine

AGNUS Brain

Story Builder

Research Panel

AI Writer

Website

The Brain should **never** search the internet directly.

It should only read from the Knowledge Engine.

Add a new section

Under

SYSTEM

I'd add

SYSTEM

Control Center

Knowledge Sources

AI Models

Prompt Library

Automation

API Connections

Logs

Knowledge Sources page

This page becomes beautiful.

Imagine cards.

Official Sources

✓ OpenAI

Status

Connected

Last sync

12 min ago

Weight

100

✓ Anthropic

Connected

✓ Google AI

Connected

✓ Microsoft

Connected

Every card has

Enable

Disable

Priority

Sync frequency

Trust level

RSS Sources

TechCrunch

Sync

Every 30 min

Priority

80

The Verge

Reuters

VentureBeat

Reddit

Artificial

MachineLearning

OpenAI

ClaudeAI

LocalLLaMA

Each one

Daily

Hourly

Disabled

GitHub

Trending

Repositories

Releases

Stars

Issues

Product Hunt

New launches.

Google Trends

This becomes one of the biggest sources.

YouTube

You decide which channels AGNUS trusts.

Example

OpenAI

Anthropic

Google

Two Minute Papers

AI Explained

Companies

This is interesting.

Each company becomes a data source.

OpenAI

Website

Pricing

API

Blog

Status

The same for

Claude

Perplexity

Cursor

Notion

Affiliate Networks

The Brain should know

Impact

Radius

PartnerStack

FirstPromoter

Rewardful

Then

It already knows

Commissions

Cookies

Products

Internal Sources

Not everything comes from outside.

The Brain also reads

Your Analytics

↓

Newsletter

↓

Marketplace

↓

Academy

↓

Reader Behavior

↓

Searches

↓

Clicks

↓

Revenue

This is actually more valuable.

Source Rules

Every source needs settings.

Example

OpenAI

Frequency

15 min

Importance

100

Use for

News

Pricing

Research

API

Source Weight

I love this.

Official

100

Reuters

95

Government

95

Academic

92

Reddit

60

Blogs

40

Now

The Brain knows

Who to trust.

Sync Engine

Imagine

Sync Now

or

Automatic

15 minutes

Everything updates.

Knowledge Database

This is the most important thing.

Instead of reading APIs every time.

AGNUS stores everything.

Imagine

Company

↓

Products

↓

Articles

↓

Pricing

↓

Features

↓

Reviews

↓

History

↓

Timeline

Then

The Brain queries

Your own database.

Not Google.

Then comes my favorite page...

Knowledge Graph

Imagine

OpenAI

↓

GPT

↓

Pricing

↓

Review

↓

Comparison

↓

Marketplace

↓

Academy

↓

Business Guide

↓

Industry Collection

Everything connected.

Then...

The Brain finally has something to think with.

Because right now

The Brain has no brain.

It's only a UI.

After Knowledge Sources...

The Brain becomes alive.

This changes AGNUS completely

Now imagine tomorrow.

OpenAI changes pricing.

The Sync Engine notices.

The Knowledge Database updates.

The Knowledge Graph marks affected content.

The Brain wakes up.

It tells you:

"OpenAI changed GPT pricing 11 minutes ago. This affects:

- 1 review
- 3 comparison pages
- 2 academy lessons
- 5 business guides
- 1 marketplace listing.

Estimated update time: 48 minutes.

Estimated revenue protected: €180/month."

You didn't search for anything.

You didn't ask.

The system is **alive**.

I would actually add ONE MORE menu

I think this belongs between

SYSTEM

and

INTELLIGENCE.

KNOWLEDGE

Knowledge Sources

Knowledge Database

Knowledge Graph

Entity Manager

Company Database

Product Database

People Database

Industry Database

Everything the Brain knows comes from there.

Everything the website displays comes from there.

Everything the AI writes is grounded in there.

This is, in my opinion, the turning point.

Until now, we've been designing **screens**.

What we've just identified is the **intelligence architecture**.

This is the layer that transforms AGNUS from "a beautiful dashboard" into "a living intelligence platform."

Without it, the Brain is only pretending to think.

With it, every recommendation, every article, every comparison, every marketplace update, and every strategic suggestion is backed by a continuously synchronized knowledge system that you control. I honestly think this is one of the most important design decisions we've made so far.

and be specific now...what exact as data source..is it google trends, is it facebook...you need to be specifif so we know where to get the data..stop playing

You're right. Let's make this concrete. If we're building AGNUS as a real product, we need to know **exactly** where every piece of data comes from.

I would build it like this.

LEVEL 1 — OFFICIAL COMPANY SOURCES (Highest Trust)

These feed **reviews, comparisons, pricing, features, changelogs**.

Source	Purpose	Method
OpenAI	Models, pricing, releases	Official API + official website/blog
Anthropic	Claude updates	Official website/API
Google AI	Gemini, Veo	Official developer documentation
Microsoft	Copilot, Azure AI	Official documentation
Mistral	Models	Official API/docs
Perplexity	Product updates	Official website
ElevenLabs	Voice features	Official docs
Runway	Video features	Official docs
Cursor	Pricing/features	Official website
Notion AI	Updates	Official website

Weight: 100/100

LEVEL 2 — SEARCH DEMAND

This feeds **Keyword Discovery** and **AGNUS Brain**.

Google Trends

Purpose:

- Rising searches
- Seasonal trends
- Geographic interest

Frequency:

Every 12 hours

Google Search Console

Purpose:

- Your rankings
- CTR
- Impressions
- Position

Every day.

Google Analytics 4

Purpose

- Time on page
- Bounce rate
- Conversion
- Scroll depth

Real user behavior.

Bing Webmaster Tools

Purpose

AI search traffic

LEVEL 3 — NEWS

Purpose

Detect breaking AI news.

Sources:

- Reuters Technology
- Associated Press Tech
- TechCrunch
- The Verge AI
- VentureBeat AI
- Ars Technica AI
- MIT Technology Review
- IEEE Spectrum AI

Every 30 minutes.

LEVEL 4 — PRODUCT DISCOVERY

Purpose

Find new software.

Product Hunt

New launches

Every day.

GitHub Trending

Purpose

Open-source AI

Trending repositories

Daily.

Hugging Face

Purpose

New models

New datasets

Trending Spaces

LEVEL 5 — RESEARCH

Purpose

Deep technical articles.

arXiv

AI papers

LLMs

Agents

RAG

Vision

Semantic Scholar

Research.

Papers with Code

Benchmarks

Leaderboards

LEVEL 6 — SOCIAL SIGNALS

Purpose

What people are discussing.

Not every social network deserves equal weight.

I would prioritize:

Reddit

Subreddits:

- r/OpenAI
- r/ClaudeAI
- r/singularity
- r/LocalLLaMA
- r/MachineLearning
- r/artificial
- r/ChatGPT

Very valuable.

X (Twitter)

Instead of everything,

create curated lists.

Example:

OpenAI

Anthropic

Google

Developers

Researchers

Founders

Do not monitor the whole platform.

LinkedIn

Company announcements.

Enterprise trends.

I would **not** prioritize Facebook.

Facebook is weak for AI intelligence.

LEVEL 7 — VIDEO SOURCES

Purpose

Find tutorials

Product demos

Reviews

YouTube channels

Example

- OpenAI
 - Anthropic
 - Google Developers
 - Two Minute Papers
 - AI Explained
 - Fireship (selected topics)
-

LEVEL 8 — AFFILIATE SOURCES

Purpose

Revenue.

PartnerStack

Impact

CJ

Awin

FirstPromoter

Rewardful

ShareASale (where relevant)

Every day

Check

Commission changes

New partners

Program closures

LEVEL 9 — MARKETPLACE SOURCES

Purpose

Detect pricing.

G2

Capterra

AlternativeTo

StackShare

These feed

Comparisons.

LEVEL 10 — YOUR OWN DATA (Most Valuable)

This is the one people forget.

AGNUS generates data itself.

Example

Searches inside AGNUS

Most read articles

Most clicked reviews

Most compared products

Newsletter clicks

Marketplace purchases

Course enrollments

Average reading time

Bookmarks

Wishlist

User comments

Premium conversions

This data becomes gold.

LEVEL 11 — MANUAL SOURCES

Some things should never be automated.

You manually maintain:

Official product screenshots

Pricing verification

Legal notes

Pros/cons

Editorial opinions

Editor's rating

So the Control Center should literally have a page like this

Knowledge Sources

Official Companies

- ✓ OpenAI
- ✓ Anthropic
- ✓ Google
- ✓ Microsoft
- ✓ Cursor

Search

- ✓ Google Trends
- ✓ Search Console
- ✓ GA4
- ✓ Bing Webmaster

News

- ✓ Reuters
- ✓ TechCrunch
- ✓ MIT Technology Review
- ✓ VentureBeat

Research

- ✓ arXiv
- ✓ Papers With Code
- ✓ Semantic Scholar

Developer

- ✓ GitHub Trending
- ✓ Hugging Face

Communities

- ✓ Reddit
- ✓ X Lists
- ✓ LinkedIn

Affiliate

- ✓ PartnerStack
- ✓ Impact
- ✓ CJ

Marketplace

- ✓ G2
- ✓ Capterra
- ✓ AlternativeTo

Internal

- ✓ AGNUS Analytics
 - ✓ Marketplace
 - ✓ Academy
 - ✓ Newsletter
 - ✓ User Searches
-

Finally: what I would NOT connect

These sound attractive but would add a lot of noise for very little value in AGNUS's first versions.

- ✗ Facebook
- ✗ Instagram
- ✗ TikTok
- ✗ Pinterest
- ✗ Quora
- ✗ Medium
- ✗ Random blogs
- ✗ General RSS aggregators

They can be added later if you have a clear use case, but I wouldn't let them influence editorial decisions early on.

My recommendation

I would start with **about 20–25 carefully chosen, high-quality sources**, not hundreds.

The goal isn't to collect the most data. It's to collect the **right** data.

A focused, trusted knowledge base will produce better articles and better recommendations than a system drowning in low-quality signals. That's how the AGNUS Brain earns trust.

now explain the architecture for these, how we organise these settings, how do we present them, where are they located in the menu,,,how do we score them etc
Ragionato per un paio di secondi

Yes. This must become its own **Knowledge System** inside the dashboard.

Menu structure

Put it under a new section called **Knowledge**.

ENGINE ROOM

- Dashboard
- AGNUS Brain

CONTENT OPERATIONS

- Intelligence Feed
- Keyword Discovery
- Research Panel
- Topic Clusters
- Article Pipeline
- Story Builder
- AI Writer
- Human Review
- Publishing Calendar
- Content Archive

KNOWLEDGE

- Knowledge Sources
- Source Scoring
- Knowledge Database
- Knowledge Graph
- Entity Manager
- Sync Logs

OPTIMIZATION

- Internal Linking
- SEO / GEO
- Media
- Performance
- Affiliate
- Coverage Map

SYSTEM

- Control Center
- AI Models
- Prompt Library
- Integrations

- Users
- Logs

The most important new page is **Knowledge Sources**.

1. Knowledge Sources page

This is where you connect everything.

The page should show source groups as cards:

Knowledge Sources

Official Companies
Search Demand
News
Research
Developer Signals
Social Signals
Affiliate Networks
Marketplace Data
Internal AGNUS Data
Manual Sources

Each card shows:

Official Companies
12 connected
Trust: 98/100
Last sync: 14 min ago
Errors: 0
[Manage]

When you click **Manage**, you see the sources inside that group.

Example:

Official Companies

OpenAI	Connected	Trust 100	Sync 15 min	Healthy
Anthropic	Connected	Trust 100	Sync 15 min	Healthy
Google AI	Connected	Trust 100	Sync 30 min	Healthy
Microsoft	Connected	Trust 98	Sync 30 min	Healthy
Mistral	Connected	Trust 95	Sync 1 hour	Healthy

Each source has buttons:

View
Edit
Sync now
Disable
Logs

2. Source settings

Every data source needs the same settings structure.

Example: **OpenAI**

Source name: OpenAI
Source type: Official Company
URL/API: <https://openai.com/news> / docs / pricing
Trust weight: 100
Sync frequency: Every 15 minutes
Used for:
☒ News
☒ Pricing
☒ Product features
☒ Reviews
☒ Comparisons
☒ Marketplace
☒ Academy
Language: English
Status: Active
Last sync: 12 minutes ago
Last change detected: Pricing page updated

Also include:

Allowed actions:
☒ Create draft automatically
☒ Alert editor
☒ Update entity database
☒ Flag affected articles
☐ Publish automatically

Never allow automatic publishing at the beginning.

3. Source scoring system

Each source gets a score from **0–100**.

Use 5 scoring factors:

Trust Score
Freshness Score
Relevance Score
Signal Strength
Noise Level

Example:

OpenAI Official Blog
Trust: 100
Freshness: 95
Relevance: 100
Signal Strength: 90
Noise: 5
Final Score: 97/100

Formula:

Final Source Score =
Trust 40%
Freshness 20%
Relevance 20%
Signal Strength 15%
Noise Control 5%

Official sources should dominate. Reddit/X can be useful, but never equal to official sources.

4. Source categories and exact scoring

Official Company Sources

Trust: 95–100

Use for: facts, pricing, product changes

Google Trends / Search Console

Trust: 85–95

Use for: demand, keyword movement

News Sources

Trust: 70–95

Use for: industry news

Research Sources

Trust: 85–95
Use for: technical depth

GitHub / Hugging Face
Trust: 75–90
Use for: developer activity

Reddit / X / LinkedIn
Trust: 40–75
Use for: early signals only

Affiliate Networks
Trust: 80–95
Use for: revenue opportunities

Internal AGNUS Data
Trust: 90–100
Use for: user behavior, conversions, priorities

Important rule:

Social signal can trigger investigation.
Social signal cannot confirm facts.

5. Knowledge Database

This is not a settings page. This is where collected data becomes structured.

Menu:

KNOWLEDGE
- Knowledge Database

Inside:

Companies
Products
People
Models
Features
Pricing
Industries
Keywords
Articles
Comparisons
Marketplace Items

Courses
Sources

Example product record:

Product: Claude
Company: Anthropic
Category: AI Assistant
Pricing: \$20/mo
Last verified: Today
Sources:
- Anthropic pricing page
- Anthropic docs
Connected content:
- Claude Review
- Claude vs ChatGPT
- Best AI Tools for Writers
- AI Agents Course

This is the **single source of truth**.

6. Knowledge Graph

This shows relationships.

Example:

OpenAI
↓
ChatGPT
↓
Pricing
↓
Review
↓
Comparison
↓
Marketplace
↓
Academy Lesson
↓
Business Guide

This is what makes the Brain intelligent.

When pricing changes, AGNUS knows exactly what pages are affected.

7. Sync Logs

This is critical.

Every sync must leave a trace.

Example:

10:42 — OpenAI pricing page checked — no change
10:48 — Anthropic blog checked — new article found
10:51 — Google Trends checked — "AI agents for small business" rising 42%
10:53 — PartnerStack checked — new affiliate program detected

Each log entry should show:

Source
Time
Status
Change detected
Action taken
Confidence
Affected content

8. How AGNUS Brain uses this data

AGNUS Brain should not invent recommendations.

It should show its evidence.

Example:

Recommendation:
Publish "Best AI Agents for Small Businesses"

Why:

- Google Trends up 42%
- Search Console shows rising impressions
- AI Agents cluster missing pillar article
- PartnerStack has 4 relevant affiliate programs
- Reader searches inside AGNUS increased 18%
- Competition difficulty medium

Confidence:
94%

Every Brain recommendation needs:

Source evidence
Confidence %
Impact
Effort
Revenue potential
Affected cluster
Suggested action

9. How to present this visually

Use three layers:

Layer 1: Overview

Big source group cards.

Official Sources	12 connected	98/100
Search Demand	4 connected	91/100
News	18 connected	84/100
Social Signals	9 connected	62/100
Internal Data	7 connected	97/100

Layer 2: Source list

Table/card list of each source.

OpenAI		Official		Trust 100		Sync 15 min		Healthy
Google Trends		Search		Trust 90		Sync 12h		Healthy
Reddit OpenAI		Social		Trust 62		Sync 1h		Noisy

Layer 3: Source detail

Full settings and logs.

10. Exact menu placement

Add this:

KNOWLEDGE

- Knowledge Sources
- Source Scoring
- Knowledge Database
- Knowledge Graph
- Entity Manager
- Sync Logs

Keep **Integrations** under System for API keys.

Difference:

Integrations = connection credentials

Knowledge Sources = what AGNUS reads and trusts

So:

- API key for Google goes in **Integrations**
- Google Trends as a data source is configured in **Knowledge Sources**

That separation is important.

Final structure

External Sources

↓

Integrations/API Keys
