

# AGNUS – Knowledge Sources – Source Detail Review (FINAL)

Overall, this is **excellent work**. This panel finally feels like an actual control center rather than just another settings page.

I would rate it **9.7/10**.

Only a few refinements remain before I would consider this production-ready.

---

## 1. General Layout

**Approved.**

The right-side drawer is the correct pattern.

Do **not** replace it with a new page.

The workflow should always be:

Knowledge Sources

↓

Select source

↓

Side panel opens

↓

Edit

↓

Save

This is fast and keeps context.

---

## 2. Header

Current:

OpenAI

I would improve it slightly.

Instead of only displaying the company name, make the header communicate identity immediately.

Example:

OpenAI

Official Company Source

Trust: 100

Status: Healthy

A small status badge next to the title would make scanning much easier.

---

## 3. URL / API Endpoint

Instead of

openai.com/news

/docs

/pricing

I would allow multiple endpoints.

Example

Primary API

api.openai.com

Documentation

platform.openai.com/docs

Pricing

openai.com/pricing

Blog

openai.com/news

Every source rarely has only one endpoint.

---

## 4. Trust Weight

Approved.

Keep this exactly.

Eventually I would make it editable through a slider.

0 — 100

instead of text input.

---

## 5. Sync Frequency

Approved.

Eventually support

5 min

15 min

30 min

1 hour

6 hours

Daily

Manual

No further changes.

---

## 6. Ingestion Type

Excellent.

Keep

✓ API

✓ RSS

✓ HTML

✓ Webhook

Eventually add

GraphQL

CSV

Crawler

Partner Feed

Manual

No redesign required.

---

## 7. Authentication

Excellent.

This looks professional.

I would only add

JWT

Basic Auth

Later.

---

## 8. Used For

This is one of my favorite parts.

Keep it.

It immediately tells AGNUS where this source contributes.

Eventually add

Knowledge Graph

Memory

Trend Detection

Recommendations

Research Brief

Entities

---

## 9. Allowed Actions

This is excellent.

One thing I'd change:

Instead of

Allowed actions

rename it

Automation Rules

because that's what it actually is.

Example

Automation Rules

✓ Create Draft

✓ Alert Editor

✓ Update Entity Database

✓ Flag Related Articles

✗ Never Publish Automatically

This sounds much more intelligent.

---

## 10. Publish Automatically

Excellent decision.

I LOVE

Never at first

Instead of

Never

I'd make it

Requires Human Approval

This sounds much more enterprise.

---

## 11. Status

Approved.

Keep

ACTIVE

Eventually support

Healthy

Paused

Disabled

Testing

Authentication Failed

Needs Attention

---

# 12. Last Change Detected

This section is excellent.

I'd simply enrich it.

Instead of

Pricing updated.

I'd display

Pricing page updated

Detected:

Today 14:12

Changes

- GPT-5 price changed
- Enterprise pricing changed

Affected

12 articles

4 comparisons

3 entities

1 review

Actions Taken

- ✓ Entity updated
- ✓ Articles flagged
- ✓ Draft created

Waiting for editor approval

This becomes an audit trail.

---

## 13. Footer Buttons

Current

Close

Sync Now

Save

Perfect.

Don't touch them.

---

## 14. Missing Section (Very Important)

I think one section is still missing.

At the bottom I'd add

Health History  
Today

Healthy

Yesterday

Healthy

7 days ago

Authentication timeout

Recovered automatically

30 days uptime

99.98%

This lets admins know if a source is reliable.

---

# 15. Missing Section (Very Important)

I'd also add

Data Coverage

This is one of the biggest enterprise features.

Example

DATA COVERAGE

Pricing

100%

Documentation

95%

Models

100%

Blog

72%

Press Releases

91%

Release Notes

100%

Videos

Disabled

Community

Disabled

Immediately you know what AGNUS is actually collecting.

---

## 16. Missing Section

I'd also add

Last Sync Summary

Example

Last Sync

32 pages checked

4 changed

1 entity updated

12 articles flagged

0 failures

Confidence

99%

That is the summary every administrator wants.

---

## Overall

This page now feels like the backend of a professional SaaS platform rather than a simple CMS.

The remaining refinements are mostly about making the system more transparent and enterprise-grade, not about changing the layout.

## Final instruction to Claude Design

- Keep the overall layout exactly as it is.
- Rename **"Allowed Actions"** to **"Automation Rules."**
- Change **"Never at first"** to **"Requires Human Approval."**
- Support multiple endpoints per source instead of a single URL field.
- Add three collapsible sections at the bottom:
  1. **Health History**
  2. **Data Coverage**
  3. **Last Sync Summary**

- Keep the right-side drawer interaction and footer actions (**Close**, **Sync Now**, **Save**) unchanged.

After those refinements, I would consider the **Knowledge Sources module complete and production-ready**. It would meet the standard expected of an enterprise AI operating system like AGNUS.
