

This is one of the strongest pages you've designed so far. In fact, I think it captures one of the biggest differentiators of AGNUS: **it doesn't merely store knowledge—it understands the consequences of knowledge changing.**

I would rate the current design **9.6/10**.

What makes it excellent is that it tells a story:

Knowledge → Relationships → Change Detection → Business Impact

That is exactly what an enterprise knowledge graph should do.

That said, if AGNUS is intended to compete with platforms like Palantir, Google's Knowledge Graph, Microsoft Graph, or enterprise knowledge systems, I would still add a few capabilities.

What I would improve

1. Multiple Graph Views

Right now it appears to have one graph.

It should support several perspectives.

Example:

Graph Views

- Entity Graph
- Product Graph
- Company Graph
- Article Graph
- Topic Graph
- Revenue Graph
- Traffic Graph
- Internal Link Graph
- Keyword Graph
- Marketplace Graph
- Course Graph
- Complete Graph

The same data, different lenses.

2. Interactive Graph Navigation

Currently nodes appear static.

Every node should support:

Expand 1 hop

Expand 2 hops

Collapse

Highlight relationships

Center graph

Trace upstream

Trace downstream

Pin node

Hide node

Show metadata

Open entity

Compare

Impact analysis

Think Neo4j Bloom.

3. Relationship Types

Different edge colors.

Example

owns

competes_with

mentions

depends_on

teaches

references

priced_against

similar_to

parent_of

child_of

causes

updates

creates

feeds

The graph becomes readable.

4. Live Change Simulation

You already have

Simulate Pricing Change

Excellent.

Now expand.

Simulate

Pricing

Feature

API Removal

Rebrand

Acquisition

Model Release

Security Issue

Company Shutdown

Affiliate Removed

Course Updated

Everything propagates.

5. Impact Explorer

Instead of

12 pages affected

Allow drill-down.

Affected

Articles

Clusters

Courses

Marketplace

Comparisons

Revenue

Traffic

Internal Links

Knowledge Graph

Each expandable.

6. Relationship Strength

Every connection should have weight.

Example

OpenAI

Pricing

Weight 98

GPT-5

Weight 95

Claude Comparison

Weight 72

Business Guide

Weight 44

Useful for AI ranking.

7. Explain Why

When clicking an edge.

OpenAI

Pricing

Claude Review

Reason

Contains monthly pricing.

Used in comparison table.

Appears in CTA.

Mentioned 6 times.

Referenced by calculator.

Explainability.

8. AI Recommendations

Panel.

Graph Suggestions

Connect GPT-5 to GPT-5 Mini

Missing Pricing Node

Relationship confidence low

Possible duplicate

New benchmark available

Missing Course Relationship

9. Timeline Mode

Imagine slider.

2024

2025

2026

Watch graph evolve.

Very impressive.

10. Orphan Detection

Extremely important.

Show

Entities

without

relationships

Example

Found 14 orphan entities.

Connect?

Review?

Archive?

11. Circular Dependency Detection

Enterprise feature.

Detect

My biggest recommendation

This is the one thing I think is missing that would elevate AGNUS significantly:

Introduce a Dependency Engine

The Knowledge Graph should not only show relationships—it should classify their operational importance.

Every edge should carry metadata such as:

- **Relationship type** (depends_on, mentions, competes_with, owns, etc.)
- **Criticality** (Critical, High, Medium, Low)
- **Propagation rule** (when this changes, what should happen?)

- **Estimated business impact** (traffic, revenue, affected content)
- **Confidence** (how certain AGNUS is that this dependency is real)

For example:

This transforms the graph from a visualization into an **active dependency management system**.

Claude Design Guidelines

Mission

Design the Knowledge Graph as the **living nervous system of AGNUS**, not as a static visualization. It should communicate how knowledge flows, how entities influence one another, and how changes propagate through the platform.

Design Requirements

- Support multiple graph views (Entity, Topic, Article, Company, Revenue, Traffic, Marketplace, Course, Full Graph).
- Nodes must be interactive: expand, collapse, pin, inspect, compare, trace upstream/downstream.
- Use distinct visual styles for relationship types.
- Clicking a node opens an inspector with:
 - entity summary
 - connected entities
 - source provenance
 - confidence
 - health
 - downstream impact
- Clicking an edge explains:
 - why the relationship exists
 - relationship type
 - confidence
 - operational criticality
 - propagation behavior
- Include a graph health dashboard showing node count, edge count, duplicates, orphan nodes, broken relationships, and overall health.
- Include simulation controls for pricing changes, feature additions, acquisitions, API changes, and other events.
- Add a time slider to visualize graph evolution over time.

- Surface AI recommendations for missing relationships, duplicates, stale nodes, and weak confidence.
- Preserve the existing clean, premium AGNUS aesthetic while making dense graph interactions easy to understand.

Yes. For the **Knowledge Graph**, I would actually give Claude Design and Codex even stricter instructions than the previous pages because this is the heart of AGNUS. If the Knowledge Graph is built correctly, every other module (Story Builder, AI Writer, Publishing Calendar, Entity Manager, Marketplace, Academy, etc.) becomes dramatically smarter.

CLAUDE DESIGN GUIDELINES

AGNUS Knowledge Graph

Mission

Design the Knowledge Graph as the central nervous system of AGNUS.

It is **not** a diagram.

It is **not** a database browser.

It is the visual representation of AGNUS' understanding of the world.

The user should immediately understand:

- what exists
- how everything is connected
- why things are connected
- what changes affect what
- where opportunities exist
- where risks exist

The graph should feel alive.
